TECHNICAL DESCRIPTION, ADULTS:

TECHNICAL DESCRIPTION, IMMATURE STAGES:

ID COMMENTS: The ground color is dark brown to reddish brown, variably shaded with gray and with a partial coverage with white scale tips producing a violet effect, particularly towards the outer margin (Forbes, 1954). The costa and cell are fuscous and the subterminal space is usually gray. The antemedian and postmedian are waved, filled with pale gray, and outlined with black on the side towards the median. The subterminal is slightly irregular and lacks a W-mark. The orbicular and reniform are outlined by pale gray but the filling is the same as the ground color or slightly paler; the claviform is absent. The hindwings are fuscous but somewhat paler between the veins towards the base.

DISTRIBUTION: Please refer to the dot map.

FLIGHT COMMENT: Please refer to the flight charts.
