TECHNICAL DESCRIPTION, IMMATURE STAGES:

ID COMMENTS:

DISTRIBUTION: Please refer to the dot map.

FLIGHT COMMENT: Please refer to the flight charts.

HABITAT: This species is common in many areas that lack Poplars and where Willows are the likely hosts.

FOOD: The larvae appear to specialize on poplars and willows (Prentice, 1966; Miller, 1987; Brown et al. 2008; Lam et al., 2011). The reported hosts include Balsam Poplar (<i>Populus balsamifera</i>), Quaking Aspen (<i>Populus tremuloides</i>) and willows (<i>Salix</i>). Forbes (1923) reported dock (<i>Rumex</i>) to be a host, which needs additional verification. Populations in North Carolina presumably feed on our native willows and perhaps other hosts.

OBSERVATION\_METHODS:

NATURAL HERITAGE PROGRAM RANKS: GNR S4S5

STATE PROTECTION: Has no legal protection, although permits are required to collect it on state parks and other public lands.

COMMENTS:
