 TECHNICAL DESCRIPTION, IMMATURE STAGES:

ID COMMENTS: This appears to be an undescribed species of *Phyllonorycter* that feeds on members of the red oak group. Note the silvery-white coloration on the head, thorax and basal half of the forewing, and the golden-tan patterning on the apical half that is margined with black scales.

DISTRIBUTION: Please refer to the dot map.  
 FLIGHT COMMENT: Please refer to the flight charts.  
 HABITAT:  
 FOOD: The host plants are apparently undocumented, but Jeff Niznik recently reared a larva from a mine on oak (probably *Quercus falcata*).
