

Apantesis nais Nais Tiger Moth

FAMILY: Erebiidae SUBFAMILY: Arctiinae TRIBE: Arctiini

TAXONOMIC_COMMENTS: The genus *Apantesis* is represented by 43 species in North America, including 13 species in North Carolina.

FIELD GUIDE DESCRIPTIONS: Covell (1984); Beadle and Leckie (2012)

ONLINE PHOTOS:

TECHNICAL DESCRIPTION, ADULTS: Forbes (1960); Ferguson (1985)

TECHNICAL DESCRIPTION, IMMATURE STAGES: Forbes (1960); Ferguson (1985)

ID COMMENTS: Species of *Apantesis* and *Grammia* resemble one another, but *Apantesis* are generally smaller and the pattern of yellow lines is usually much more reduced, with the median, lower portion of the post-median, and fine vein lines always missing in *Apantesis*; a good quality photograph showing the forewing pattern is usually enough to distinguish between these genera. However, the hindwings must also be visible to distinguish between the species of *Apantesis*, and even then only the males can usually be diagnosed; photographs must show the hindwings to be acceptable as records for this genus. (Note: The species formerly in the genus *Grammia* have been moved to *Apantesis*).

Apantesis nais is usually somewhat larger and broader-winged than the other species and males are usually identifiable where they possess a solid yellow hindwings with a row of large black spots or a broad band of black in sub-terminal area. *A. anna* is similar in color, but has a much more complete forewing pattern. *A. carlotta* has an almost identical pattern but has a much paler shade of yellow on the hindwings and never has a solid band of black in the sub-terminal area (except in females). *A. phalerata* can also have pale, cream on the hindwings, but has only small, scattered spots in the sub-terminal area. Males can also have hindwings that are largely red or yellowish-red, resembling *A. vittata*, although the subterminal black band usually broken into large spots in *A. nais* and more solid in *A. vittata*. Unfortunately, dissection does not provide a more definitive identification: the features of the valves and aedeagus in *A. vittata*, *A. nais*, and *A. carlotta* are all similar, showing similar patterns of variation. Female *A. nais* are similar to those of *A. phalerata* and *A. vittata* in having a highly reduced set of pale lines on the forewings and broad, confluent black bands in the sub-terminal area of the hindwing. Individuals with bright yellow in the basal and medial area of the hindwings are usually safe to identify as *A. nais*; female *A. carlotta* have a paler yellow shade and also have a much more complete set of yellow stripes on the forewings. Females with red hindwings probably cannot be safely distinguished from those of *A. phalerata* and *A. vittata*.

DISTRIBUTION: Appears to be absent over most of the southern Coastal Plain and uncommon in the Piedmont.

FLIGHT COMMENT: Forbes (1960) states that *A. nais* has two flights, which appears to be the case in North Carolina, although our data are too sparse to determine a precise pattern.

HABITAT: Ferguson (1985) described *A. nais* as a woodland species, in contrast to *A. carlotta*, which he characterized as a grassland species. Our records are consistent with this description, almost all coming from hardwood forests and peatlands and none from the grasslands associated with Longleaf Pine habitats or the dune grasslands on the barrier islands.

FOOD: Larvae are probably polyphagous, feeding on a wide range of plants. Tietz (1972) specifically lists Common Plantain (*Plantago major*), Erect Knotweed (*Polygonum erectum*), Common Dandelion (*Taraxacum officinale*), clover (*Trifolium*), and violet (*Viola*).

OBSERVATION_METHODS: Males come moderately well to blacklights but not at all to bait; females are collected at lights far less often.

NATURAL HERITAGE PROGRAM RANKS: G5 SNR [S4]

STATE PROTECTION: Has no legal protection, although permits are required to collect it on state parks and other public lands.

COMMENTS: Uncommon but found in general forested habitats across at least two-thirds of the state; probably is secure.
