ID COMMENTS:

DISTRIBUTION: Please refer to the dot map.

FLIGHT COMMENT: Please refer to the flight charts.

HABITAT: This species is associated with mesic to dry forests (Wagner et al., 2011). Our records come from sites that meet that general description but fall primarily into just a few types: maritime forests, pond-pine woodlands and non-riverine swamp forest, and dry upland woodlands. The one common denominator is the presence of pines, the color of dead needles is a good match for the coloration of this moth.

FOOD: Larval feeding preferences are not well documented but most are believed to feed on dead leaves and other detritus (Wagner et al., 2011)
